

Introduction to Cloud Computing

<https://portal.futuregrid.org/contrib/cloud-computing-class>
by various contributors
(see last slide)

Request for contributors

Hi and thanks for your contribution!

If you have modified something, I'm kindly asking you to

- put your name in the last slide
- write a quick note the next slide concerning what you have modified/added/deleted (since googledocs does not provide this feature, it only says who has modified the presentation and how many slides)

Massimo Canonico (mex@di.unipmn.it)

If you want to become an editor, just send me an email!

Revision history

24/06/11 - M. Canonico - added "ToDo" slide
23/06/11 - M. Canonico - added "request for contributors" slide

ToDo list

- Find a better pic for "Impact of Cloud computing on the Governance structure of IT organization" (it needs a better resolution)
- Find a better pic for "Community Cloud"
- Fix layout of Virtualization slides
- Find good pics for IaaS, PaaS and SaaS
- In some of the European countries, Government regulations do not allow customer's personal information and other sensitive information to be physically located outside the state or country. Do you know where?
- contributors... what else?

First: do not be scared!

Outline

- Definitions
- Cloud Computing Models
- Public and Private Cloud
- Cloud Computing Benefits
- Cloud Computing Challenges

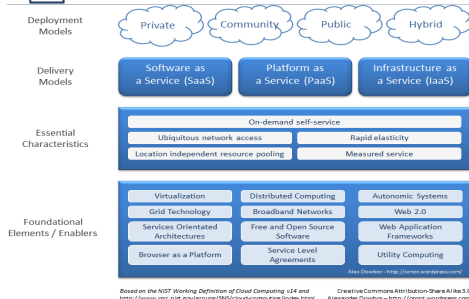

Definition

- „Cloud computing is a model for enabling ubiquitous, convenient, on-demand network access to a shared pool of configurable computing resources (e.g., networks, servers, storage, applications, and services) that can be rapidly provisioned and released with minimal management effort or service provider interaction.“ (NIST)
- “Cloud computing is Internet-based computing, whereby shared resources, software and information are provided to computers and other devices on-demand, like electricity” (Wikipedia)

NIST Cloud Definition Framework

„Alternative“ definitions

- The term “Cloud computing” is misleading. As a marketing **buzzword**, it's used to suggest that something **new** and **better** is going on, when in fact there may be **nothing new** about it.
- Cloud computing simply **increases** the number of **things** that can go **wrong**. And go wrong they do.
- Cloud Computing is a business concept, not a technological jargon dependent on "as a service model"

In principle, there were

- Grid computing
- Utility computing
- Virtualization

Grid Computing

Grid computing

- Grid computing (or the use of a computational grid) is applying the resources of **many computers** in a network to a **single problem** at the same time - usually to a scientific or technical problem that requires a great number of computer processing cycles or access to large amounts of data.

Utility computing

- Utility computing is the packaging of **computing resources**, such as computation, storage and services, as a **metered service** similar to a traditional public utility (such as electricity, water, natural gas, or telephone network). This model has the advantage of a **low or no initial cost** to acquire computer resources; instead, **computational resources** are essentially **rented** - turning what was previously a need to purchase products (hardware, software and network bandwidth) into a service.

Virtualization

- Virtualization is the creation of a **virtual** (rather than actual) version of something, such as a **hardware platform, operating system, a storage device or network resources**.

Role of Virtualization

- **Virtualization**
 - Abstraction layer that decouples computation from physical resource
- **Motivations**
 - Resource *sharing* with security and isolation
 - Similar to multi-user/multi-programming
 - Ease of management
 - Virtual machines (bits) vs. physical resources (hardware)
 - E.g.: start/stop, clone, migrate, suspend an entire virtual machine

Virtualized Computers

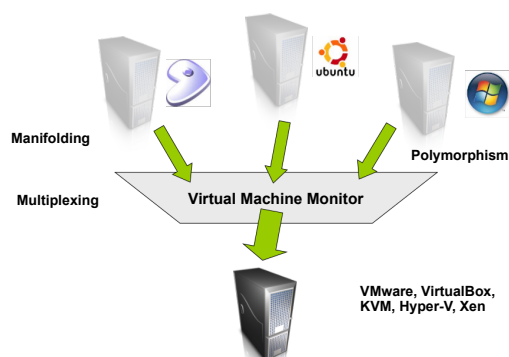

- A definition for "virtual":
 - "Common alternative to *logical*; often used to refer to the artificial objects created by a computer system to help the system control access to shared resources."
[Free Online Dictionary of Computing]
- **Virtual machines (VMs)**
 - Key enabling virtualization technology
 - Initial developments in the early 70s
 - Sharing of mainframe computers by multiple legacy O/Ss
 - "Renaissance" when x86 platforms were virtualized
 - VMware; Xen, KVM, VirtualBox, Hyper-V, ...

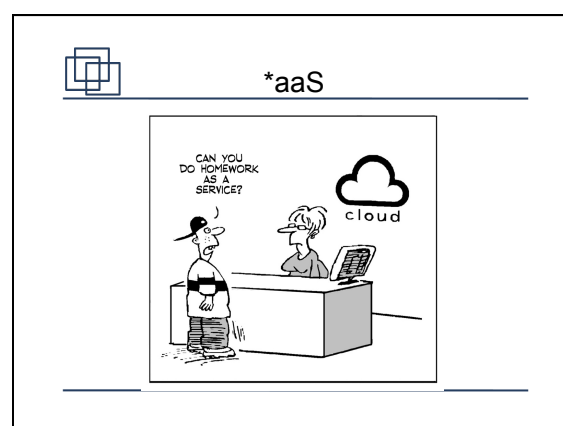

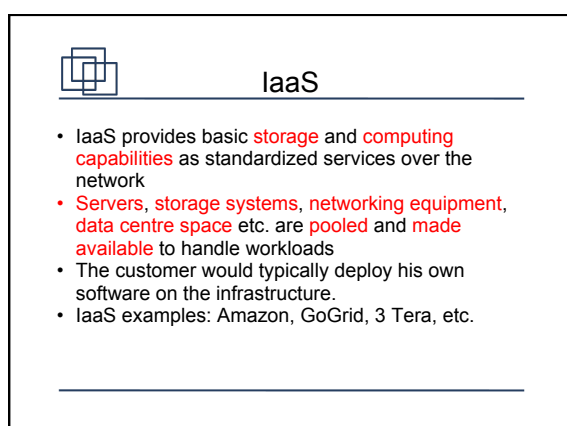

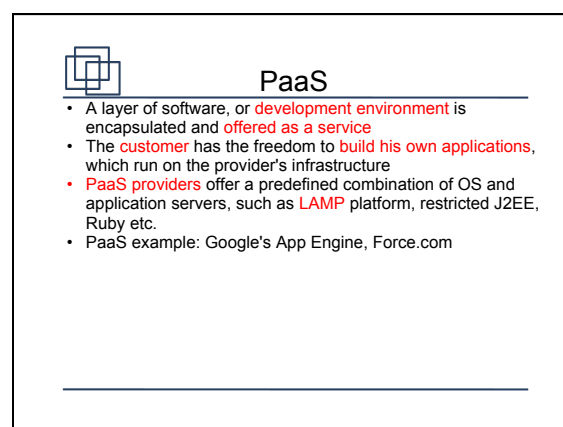

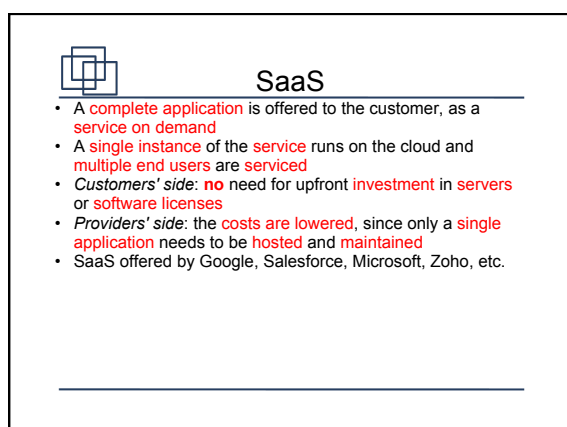

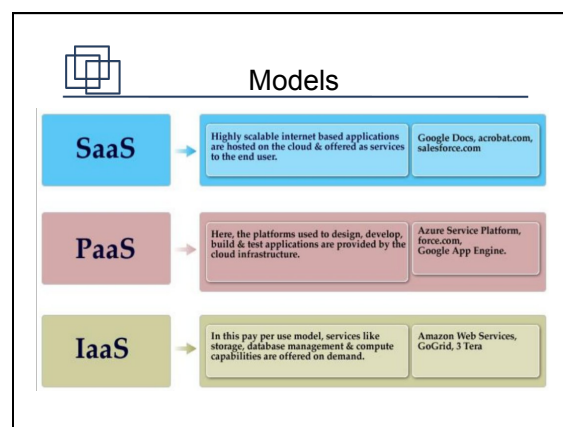

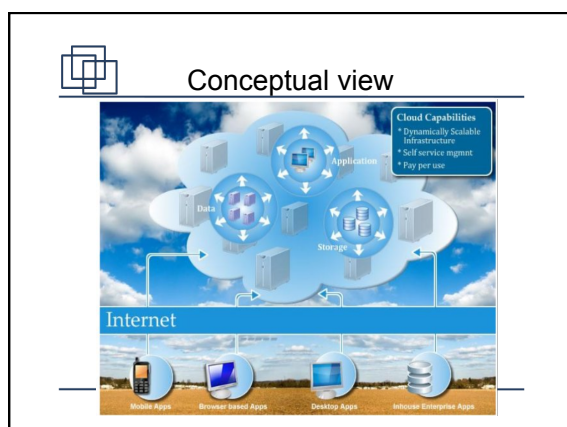

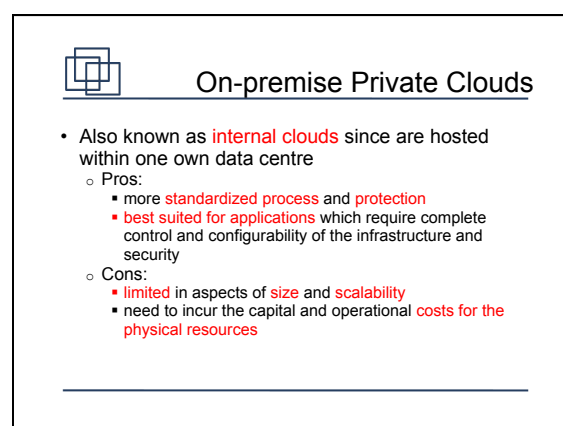

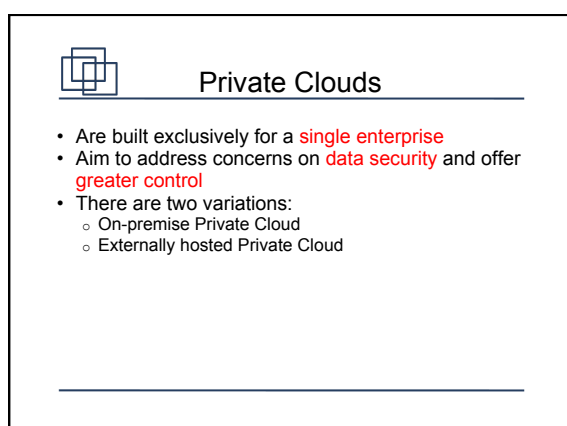

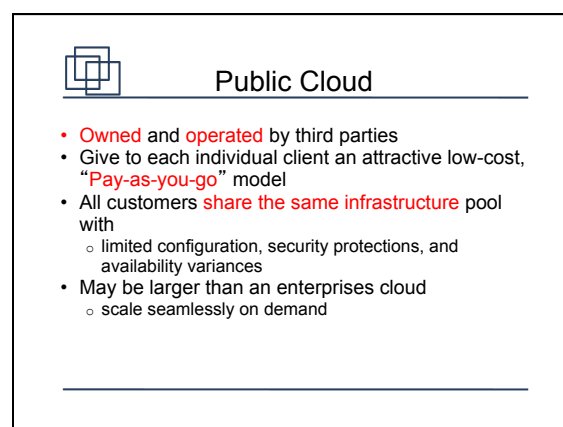

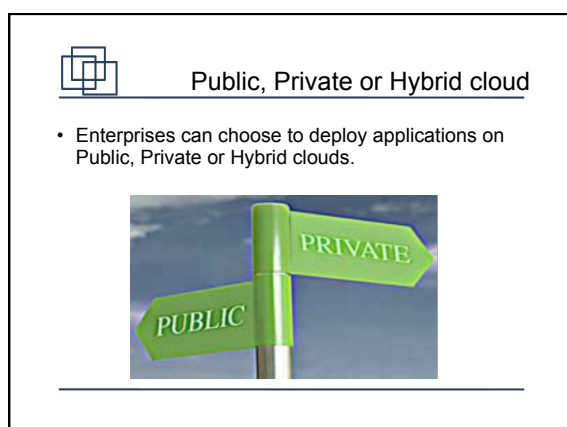

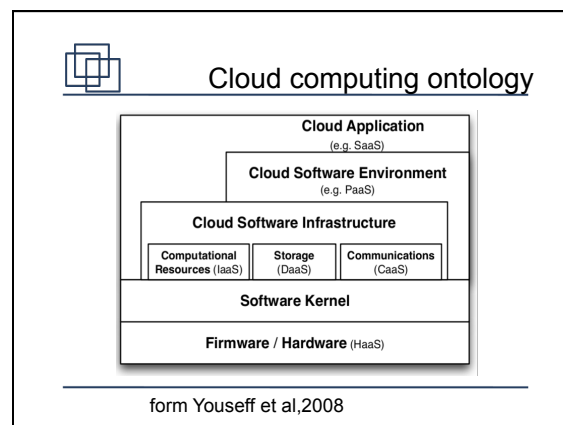

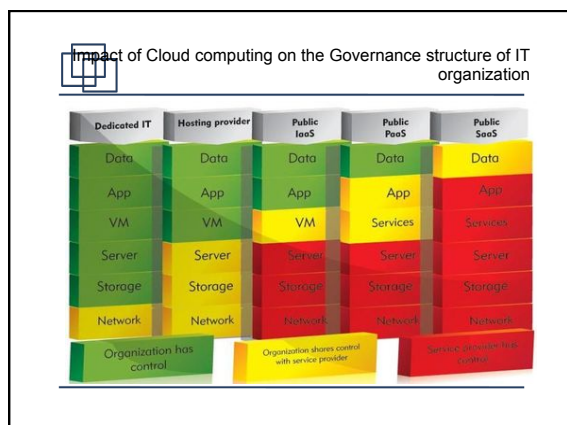

"Classic" VMs defined

- "A virtual machine is taken to be an **efficient, isolated, duplicate** copy of the real machine" [2]
 - "A statistically dominant subset of the virtual processor's instructions is executed directly by the real processor"[2]
 - "...transforms the single machine interface into the illusion of many"[3]
 - "Any program run under the VM has an effect identical with that demonstrated if the program had been run in the original machine directly"[2]
- Bottom line: **near-native performance for many applications; time/space sharing with strong isolation; runs unmodified O/Ss and applications**

Virtual Machines

Externally hosted Private Cloud

- Hosted externally with a **cloud provider**
- The provider facilitates an **exclusive cloud environment** with full **guarantee of privacy**
- Best suited for **enterprises that don't prefer a public cloud** due to sharing of physical resources

Community Cloud

Hybrid cloud

Hybrid Clouds

- Combine both public and private cloud models
- Service providers can utilize 3rd party Cloud Providers in a full or partial manner thus increasing the flexibility of computing
- The ability to augment a private cloud with the resources of a public cloud can be used to **manage any unexpected surges in workload**

Cloud Computing benefits

- Some of the typical benefits are listed below:
 - Reduced cost
 - Increased storage
 - Flexibility

Reduced cost

- The billing model is **pay as per usage**
- The infrastructure is not purchased thus **lowering maintenance**
- **Initial expense** and recurring expenses are **much lower** than traditional computing.

Increased storage

- With the massive infrastructure that is offered by Cloud providers today, storage and maintenance of **large volumes of data is achievable**
- Sudden **workload spikes** are also managed effectively and efficiently, since the cloud can **scale dynamically**

Flexibility

- With enterprises having to **adapt**, even more rapidly, to **changing business conditions**, speed to deliver is critical
- Cloud computing stresses on getting **applications to market very quickly**, by using the most appropriate building blocks necessary for deployment

Cloud Computing Challenges

- Despite its growing influence, concerns regarding cloud computing still remain.
- Some common challenges are:
 - Data Protection
 - Data Recovery and Availability
 - Management Capabilities
 - Regulatory and Compliance Restrictions

Data protection

- Data Security is a crucial element that warrants scrutiny
- Enterprises fear **losing data** to competition and the **data confidentiality** of consumers
- Moreover, the actual storage location is not disclosed, adding onto the security concerns of enterprises
- Service providers are responsible for maintaining data security and **enterprises would have to rely on them**

Data Recovery and Availability

- All business applications have **Service level agreements (SLA)** that are stringently followed
- Cloud providers must serve
 - Appropriate clustering and Fail over
 - Data Replication
 - System monitoring
 - Maintenance
 - Disaster recovery
 - Capacity and performance management

Management Capabilities

- Despite there being multiple cloud providers, the **management of platform** and infrastructure is still in its **infancy**
- Features like „**auto-scaling**“ for example, are a crucial requirement for many enterprises
- There is **huge potential** to improve on the **scalability** and **load balancing** features provided today

Regulatory and Compliance Restrictions

- In some of the European countries, **Government regulations do not allow** customer's personal information and other sensitive information to be **physically located outside the state** or country
 - In order to meet such requirements, **cloud providers** need to **setup a data center** or a storage site exclusively **within the country** to comply with regulations.
 - Having such an infrastructure may not always be **feasible** and is a big challenge for cloud providers
-

Conclusions

- With cloud computing, the action moves to the **interface**
 - that is, to the interface **between service suppliers** and **multiple groups of service consumers**
 - **Cloud services will demand expertise in distributed services**, procurement, risk assessment and service negotiation
 - areas that many enterprises are only modestly equipped to handle
